

Due date

08/31 24:00

Contact me early if you can't make the submission deadline

Length

~ 5 pages (no hard limit in either direction, keep it reasonable)

General

Visualize results and data where possible

Give concrete examples

File format doesn't matter (as long as I can open it)

Can be formatted like a small paper/thesis, but other styles are fine as well, as long as they contain all necessary information

Abstract

What was the goal of the project?

What was done?

What are the results?

Introduction

Problem statement

Explanation of data

Explanation of techniques used

Results

Provide a short reasoning for every step taken

Dataset characteristics and whether they may affect the training process, including mitigation strategies

Overview of design and training process

What was optimized?

Show examples

Explain what you measured (metrics etc.) and to what end

For any pixel-unit metrics (Hausdorff distance, areas etc.), scale your metrics to the original image size (1024x1024) if you inferred on scaled images

Discussion

Particular challenges with data/task/etc.?

Reflection of results (what went wrong? What went right? Why?)

Comparison to other works (Check winning solutions)

What could be done better next time?

Methods

Dataset description (Annotation complete? Quality? Imbalance?)

Architecture description, incl. hyperparameters

Preprocessing, postprocessing

Training settings (learning rate scheduler, optimizer etc.)

Reproducibility: versions etc.

Code

Feel free to include code. If information is missing from your paper, I'll try to locate it in your code, so it can be beneficial. Conversely, I won't deduct points for mistakes in the code
